

Counter Electronic Detection

Just about anybody can be the target of so called bugging or covert eavesdropping, with some people at greater risk than others for a number of reasons, mainly because of their work, legal reasons [civil and criminal] and their domestic situation i.e. cheating partner or imminent divorce and settlement.

We will detect devices from the cheapest, lowest quality devices to the extremely sophisticated with state of the art equipment.

Our skilled operators will very closely examine each sweep made using a "Discone" antenna and radio spectrum analyser looking for abnormal transmissions within the segment of the radio spectrum under examination, which although targeting one room, will also indicate suspicious spurious signals throughout the building and beyond.

A physical search of the target area is the root of all counter surveillance operations, whether the target is commercial, residential or a vehicle. A physical search may be the only means

to uncover certain non-emitting surveillance devices, such as hard-wired microphones, fibre optic microphones, passive resonators and inactive remote controlled "dormant" devices. During the course of the physical search all telephone devices, electrical sockets; light switches, electrical equipment, furnishings, wall coverings, ceilings and floors will be examined.

Finally, the main telephone exchange and sub exchanges within the target building are closely examined for parasitic devices, radio and non-radio.

Any device detected throughout the whole of the sweep, active or inactive, will be reported to a nominated senior person immediately and further instruction sought before removal.

The operation is then followed up by a detailed report.
